Problem Statements

	A	B
Problem Statement	How do we determine the appropriate **categories** of sources?	How do we determine the accurate **weightage** of sources?
Proposed Activity	Run a test on a wide list of (quantitative) data sources, tagged by industry classification (UEN vs SSIC, from ACRA API). By controlling for trend and seasonal patterns, target **remainder** as independent variable.	Run a scan of as many known retrenchment cases as possible and compare reoccurring signals. For example, if "company exits market of neighbouring region" shows up repeatedly in multiple cases, weight it higher.
Input Sources (from NTUC)	List of quantitative data sources (e.g., ~~hotel room bookings, oil and gas prices,~~ SingStat data, MOM reports, eGazette, etc.) [IRA].	List of past (publicly known) retrenchment cases, with company name, date of incident [OPD] and number of workers retrenched [IRA].

Notes

- Scope to (i) company and (ii) industry level insights.
- Scope to F&B (Twelve Cupcakes, Lazada, Deliveroo) and Tech (Bytedance, Meta) industries.
- Looking at two lead timeframes of 6 months and 1 month.

Proposed Activity B

NTUC to provide:

(B1) List of Retrenchment Cases

Cases with Corresponding Signals

List of Signal Categories, Ranked by Correlational Strength

Set of Rules to Determine Signal Weightage

This set of rules should then serve to provide consistent and reliable risk assessment scores.

Run the model using the list of retrenchment cases (such as “Twelve Cupcakes 2025”) to generate a list of corresponding signals.

Please see also, for more cases:

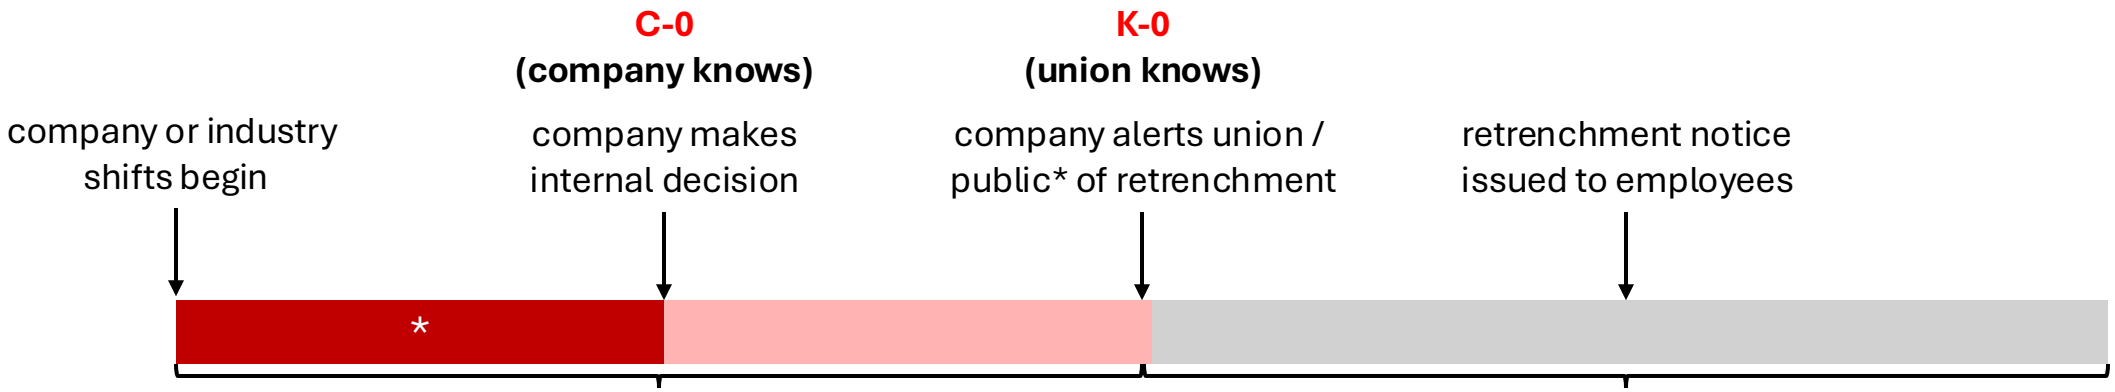
Today's Workflow: Retrenchment



IRO ACTIVITIES	Union may get informal, advance notice from the company if they have a positive relationship with HR or an inside source. If not, they will only be informed by the company via their HR department.		As soon as the union is aware of the retrenchment exercise, they can begin providing career support to the impacted employees.
INFO SOURCES	Internal informal sources within the company; industry-specific data (hotel prices, oil prices, AI transformation, etc.)	Company's HR department.	N.A.

* Note that there are instances where the union knows **before** the retrenchment is announced to the public (via the news), as well as other instances where the union knows **as** the retrenchment is announced to the public.

Proposed Key Dashboard Features

Layer 1:
Industry Dashboard (Analyst)

Output: Industry trends and retrenchment forecast (6-month lead time), plus toggle option to filter by industry.

Users at one glance should be able to get (i) the overall impression of the state of their industry and (ii) the industry's likely retrenchment figures.

Data Sources:
- SINGSTAT Industry Data
- MOM Retrenchment and Unemployment Reports
- [Potential Industry Indicators]

Layer 2:
Company Dashboard (Officer)

Output: Alerts flagging companies that have entered "high risk" categorisation (with 1-month lead time); news about companies in the respective industry over the past week.

Users at one glance should be able to glean (i) any major industry happenings, (ii) if any companies within their sector have been assigned a "high risk" retrenchment assessment score (1-month lead time) (e.g., "Deliveroo = 74, Flagged"). This information should serve as a lead for them to pursue further investigation.
